

Reflection:

Starting this project meant more than just rushing into coding. We had to understand the goal, think about the best way to do it, and finally we had to split the work between us. For a new language, it was a bit hard: we didn't know the time needed to create every feature, but thanks to our background in programming, we had a vague idea. We helped each other to discover new tools – Git and Javadoc for example. Alone, we wouldn't even think about using those: the typical “selfish-coding”, where we don't document our code and we don't use Git because we “don't need it”, is not possible in team. Finally, we have to respect good coding practices: poorly chosen names are prone to errors and to bugs, 1000 lines functions are impossible to understand etc... To summarize, what I think is that we have to code for the people who will read our code. That's the only way to reach a common goal. That's what working with others means.
